

# Windows Ansible Connection by winrm

## Step1: Create Two Ec2 Instances (Windows & Linux) on AWS.

### 1) Start Linux server with putty and execute below commands.

1) Update Linux server

```
$ sudo apt-get update
```

2) upgrade

```
$ sudo apt-get upgrade -y
```

3) Install Prerequisites for ansible installation

```
$ sudo apt install software-properties-common
```

4) Add the Ansible Personal Package Archive (PPA)

```
$ sudo add-apt-repository --yes --update ppa:ansible/ansible
```

5) Install Ansible

```
$ sudo apt install ansible
```

6) Verify the Installation

```
$ ansible --version
```

7) Install 'python3-venv'

```
$ sudo apt install python3-venv
```

8) Create a Virtual Environment

```
$ python3 -m venv myenv
```

9) Activate the Virtual Environment

```
$ source myenv/bin/activate
```

10) Install pywinrm within the Virtual Environment

```
$ pip install pywinrm
```

11) Deactivate the Virtual Environment

```
$ deactivate
```

12) Create one directory

```
$ mkdir windows_ansible
```

13) Create host file inside directory

```
$ vi hostfile
```

**Note:** Enter below host contain in this hostfile

```
[windows]
```

```
windows_host ansible_host=13.234.66.99
```

```
[windows:vars]
```

```
ansible_user=Administrator
```

```
ansible_password=0Gi9(v9S=L2$1A72P)y)wJ0*jT68L-jM
```

```
ansible_port=5985
```

```
ansible_connection=winrm
```

```
ansible_winrm_transport=basic
```

```
ansible_winrm_scheme=http
```

```
ansible_winrm_server_cert_validation=ignore
```

**Note:** below Changes need in the host file.

Replace 'windows\_host ansible\_host' with your windows server host Ip.

Replace 'ansible\_password' with your windows RDP password.

## 2) Start windows server with RDP and execute below commands.

1) Enable PowerShell remoting

```
# Enable-PSRemoting -Force
```

```
$ winrm quickconfig
```

2) Set WinRM service startup type to automatic

```
$ Set-Service WinRM -StartupType 'Automatic'
```

### 3) Configure WinRM Service

```
$ Set-Item -Path WSMan:\localhost\Service\Auth\Certificate -Value $true
$ Set-Item -Path 'WSMan:\localhost\Service\AllowUnencrypted' -Value $true
$ Set-Item -Path 'WSMan:\localhost\Service\Auth\Basic' -Value $true
$ Set-Item -Path 'WSMan:\localhost\Service\Auth\CredSSP' -Value $true
```

### 4) Configure Trusted Hosts

```
$ Set-Item WSMan:\localhost\Client\TrustedHosts -Value "35.154.198.224" -Force
---- Note: replace this ip with ansible server public ip
```

### 5) Set LocalAccountTokenFilterPolicy

```
$ New-ItemProperty -Name LocalAccountTokenFilterPolicy -Path
HKLM:\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System -PropertyType
DWord -Value 1 -Force
```

### 6) Set Execution Policy to Unrestricted

```
$ Set-ExecutionPolicy Unrestricted -Force
```

### 7) Restart the WinRM service

```
$ Restart-Service WinRM
```

### 8) List the WinRM listeners

```
$ winrm enumerate winrm/config/Listener
```

## Step2: Check Windows Ansible connection:

**Note:** Open the Linux server where we have installed Ansible and check the connection by using the below command.

### 1) Check windows Ansible connection.

```
$ ansible -i hostfile windows -m win_ping
```

**Our Expected result:**

```
(myenv) root@ip-172-31-8-208:/home/ubuntu/Windows_Ansible# ansible -i hostfile windows -m win_ping
windows_host | SUCCESS => {
  "changed": false,
  "ping": "pong"
}
```

### Step3: For test actual connection.

Create an Ansible playbook on a Linux server to **create** a directory and file on windows server, then execute that playbook by using the command below.

1) Ansible playbook

```
$ vi test_playbook.yml
```

```
---
```

```
- name: Create folder and file on Windows desktop
```

```
  hosts: windows_host
```

```
  gather_facts: no
```

```
  tasks:
```

```
    - name: Create directory on desktop
```

```
      win_shell: New-Item -Path "\Desktop\NewFolder" -ItemType Directory
```

```
      become: yes
```

```
      become_user: Administrator
```

```
    - name: Create file inside the folder
```

```
      win_shell: Out-File -FilePath "\Desktop\NewFolder\example.txt" -InputObject
```

```
"Hello, World!"
```

```
      become: yes
```

```
      become_user: Administrator
```

2) Execute ansible playbook

```
$ ansible-playbook -i hostfile test_playbook.yml
```

**Note:** After executing the playbook successfully, you can check the results on your Windows server at the specified location.

```
(myenv) root@ip-172-31-8-208:/home/ubuntu/Windows_Ansible# ansible-playbook -i hostfile test_playbook.yml
PLAY [Create folder and file on Windows Server] *****
TASK [Create directory] *****
changed: [windows_host]
TASK [Create file] *****
changed: [windows_host]
PLAY RECAP *****
windows_host : ok=2    changed=2    unreachable=0    failed=0    skipped=0    rescued=0    ignored=0
```

## Step4: Remove created directory and file from windows.

Create an Ansible playbook on a Linux server to **remove** a directory and file from windows server, then execute that playbook by using the command below.

### 1) Ansible playbook

```
$ vi remove_folder_file.yml
```

```
---
```

```
- name: Delete folder and file on Windows desktop
```

```
  hosts: 13.201.185.247
```

```
  gather_facts: no
```

```
  tasks:
```

```
    - name: Delete file inside the folder
```

```
      win_shell: Remove-Item -Path
```

```
"C:\Users\Administrator\Desktop\NewFolder\example.txt" -Force
```

```
      become: yes
```

```
      become_user: Administrator
```

```
      ignore_errors: yes # Ignore errors if the file does not exist
```

```
    - name: Delete directory on desktop
```

```
      win_shell: Remove-Item -Path "C:\Users\Administrator\Desktop\NewFolder" -
```

```
Recurse -Force
```

```
      become: yes
```

```
      become_user: Administrator
```

```
      ignore_errors: yes # Ignore errors if the folder does not exist
```

### 2) Execute ansible playbook

```
$ ansible-playbook -i hostfile remove_folder_file.yml
```

**Note:** After executing the playbook successfully, you can check the results on your Windows server at the specified location.

```
(myenv) root@ip-172-31-8-208:/home/ubuntu/Windows_Ansible# ansible-playbook -i hostfile remove_folder_file.yml
PLAY [Delete directory and file on Windows Server] *****
TASK [Delete file] *****
changed: [windows_host]
TASK [Delete directory] *****
changed: [windows_host]
PLAY RECAP *****
windows_host      : ok=2    changed=2    unreachable=0    failed=0    skipped=0    rescued=0    ignored=0
```
